

TOSHIBA

Rechargeable Lithium-ion Battery

SCiB™

SCiB™ uses lithium titanium oxide in its negative electrode to achieve excellent characteristics

Safety

Low risk of fire or explosion

In case of an internal short circuit, the lithium titanium oxide (LTO) in the negative electrode layer of SCiB™ phase transforms to being highly resistive, thus minimizing risk of drastic current flow that may lead to rupture, fire, or other accidents.

Performance at low temperature

Usable even at -30°C*

Since there is almost no lithium metal deposition even at low temperature usage, repeated charging and discharging is possible at -30°C.

*Operating temperature range depends on cell type.

Long life

Cycle life of 20,000* times or more

The capacity remains at 70% or more even after 20,000 times of charging/discharging. SCiB™ also has small degree of deterioration even with float charging**, making it usable for applications that keep constant voltage such as backup power supply.

*Cycle characteristics depends on cell type and usage conditions
** Float charging: Float charging means continuous constant voltage charging.

High input/output

Large current for both input and output

SCiB™ can accept large current input and output. Thus, it can store large regenerative energy generated during deceleration of railways and automobiles, and can supply large current necessary for starting the motor.

Rapid charging

Rapidly charges to about 80% of the capacity in 6 minutes

The favorable negative electrode charging characteristics provide rapid charging to about 80% of the capacity in 6 minutes.

Note: Characteristics depends on cell type and usage conditions

Wide effective SOC* range

Available SOC range of 0 to 100%

SCiB™ exhibits excellent input/output characteristics over a wide SOC* range. This makes it possible to reduce the nominal battery capacity or amount of batteries necessary for a system, as compared to other batteries that have a narrower SOC range.

* SOC: State of Charge

The indicated data were measured under specific conditions. The performance varies according to the customer's condition for use.

Widespread Revolution in Energy Usage

Hybrid electric vehicles
The high input/output capability of SCiB™ makes it possible to efficiently store the large electric energy generated during deceleration and braking, improving fuel efficiency and reducing emissions.

Plug-in hybrid vehicles
Battery systems composed of small SCiB™ cells help realize safe, long-life, and rapidly rechargeable electric vehicles.

Lead-acid replacement battery
Featuring high power and long life even at low temperature, SCiB™ is an easy replacement for automotive lead-acid batteries.

Cranes
SCiB™ allows cranes to efficiently use the large kinetic energy that is generated while freight containers are lowered, contributing to improving fuel efficiency and reducing emissions.

Electric ships
The minimum battery space required by SCiB™ makes it possible to secure spacious cabin. SCiB™ enables efficient operations of electric ferries with a small quantity of batteries.

Electric buses
Electric buses using SCiB™ can be charged in a short period of time. A reduction in the quantity of batteries makes it possible to secure a spacious passenger cabin and reduce costs.

Hybrid buses
SCiB™ allows buses and other large vehicles to efficiently convert large kinetic energy into electric energy.

Hybrid trucks
SCiB™ efficiently accepts the regenerative energy to assist the acceleration during upward slope or as an energy source of air conditioner/refrigerator while the engine is idle.

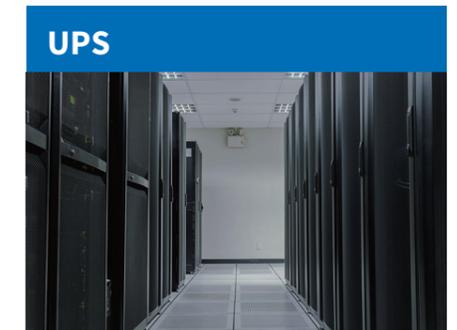

Railway
SCiB™ is suitable for the electrification of diesel locomotives. It can also be used to provide electric energy while a train is running on non-electrified sections and even in the event of emergency.

AGVs and AMRs
SCiB™ eliminates battery replacement because of its outstanding rapid-charging performance, enabling unattended operations of automated guided vehicles (AGVs) and autonomous mobile robots (AMRs).

Electric power systems
Taking advantage of its long life and high input/output, SCiB™ realizes a storage battery system with high reliability and excellent life cycle economy for power supply/demand regulation and VPP.

UPS
SCiB™ helps realize small, light uninterruptible power supply (UPS) systems, improving space utilization and reducing battery replacement costs.

IoT
SCiB™ enables safe, small battery systems to support the development of IoT infrastructure because of its high input/output density close to that of capacitors, long life, and low-temperature operation.

Drones
While conventional drones require battery replacement, SCiB™ makes it possible to create new drones that eliminate the need for battery replacement.

Lineup of Toshiba Rechargeable Battery SCiB™, selectable according to your application

Cell		There are three lineups: High-energy type, High-power type, and Combination type. The High-energy type cell is suitable for applications requiring large capacity such as electric in a short time such as during regenerative braking. The Combination type is suitable for vehicles and stationary storage systems. The High-power type is suitable for applications requiring large current charge/discharge applications requiring both large capacity and large current charge/discharge.

 ※ 23Ah and 10Ah cell use part of technology achievement made by Japan's New Energy and Industrial Technology Development Organization (NEDO) subsidized projects.
 ※ Specifications shown herein are not guaranteed values. These values are subject to change without notice. Performance depends on usage conditions.

Module / Pack		This consists of more than one cell combined to obtain the required capacity and voltage. A cell monitoring unit (CMU) is mounted, and controller area network (CAN) communication provides transmission of the voltage data and temperature data. Additionally, SCiB™ Industrial Pack is equipped with a battery management unit (BMU) and does not require an external protection circuit for use.

Components

Battery modules are built up into larger arrays with peripheral battery system components. Toshiba has battery system components available for building battery systems. Following is part of the products.

Photo			
Product name	①BMU (Battery Management Unit)	②Current sensor	③Termination plug
Type	2G type (BMU-2G-RJ45)	C2 type (CAN communication)	-
Model name	5P4E0124P001	PUR-0000145	5P4E0003P001
Function	- Cell voltage/ battery module temperature monitoring - Battery protection & SOC calculation - Communication with customer's upper controller via Ethernet/CAN	Measurement of charging/discharging current	Termination resistor for CAN communication

For more details & other components (Connector, Service disconnect, Current leak sensor, Self-starter gateway for BMU and related cables), please visit our website and refer to our catalog of "Battery System Components".

From Inquiry to Delivery

SCiB™ can be used in a wide range of applications, such as automotive, railway, industrial equipment, power equipment and power supply solutions for buildings and facilities. To customers who are considering using the SCiB™ for mass production, please feel free to contact us from the following Website.

For detailed information of this product, please visit our Website.

Manufacturing Sites

SCiB™ is manufactured at 2 factories, Kashiwazaki Operations (Kashiwazaki City, Niigata Prefecture) and Yokohama Battery Operations (Yokohama City, Kanagawa Prefecture). It is produced under a high-level quality system that complies with IATF16949/ISO9001.

Toshiba is actively engaged in environmental conservation activities and is in the process of acquiring ISO14001 certification. Renewable electricity has been introduced 100% at both factories toward decarbonization.

Yokohama Battery Operations

Safety precautions

- Do not use this product for facilities in which there is a risk to human life or a disruption to public functionality if the product fails or malfunctions (nuclear power generator controls, aerospace applications, traffic equipment, life support equipment, safety equipment, and others).
- This product is produced under strict quality controls, however it may malfunction depending on the operating environment and conditions. Please consider countermeasure design (redundancies, failsafe measures, etc.) if using this product in facilities in which failure of the product would be expected to cause a great loss or accident.
- The operating environment must be within the range of specifications noted in the catalog and instruction manuals. Using the product outside the specified range may cause injury, a re, or some other accident.
- Be sure to carefully read the instruction manuals before using this product so that you can use it correctly.
- Toshiba is not responsible for any losses related to malfunctions or abnormalities in equipment or devices connected to the product when the product fails or malfunctions, including losses from other secondary repercussions.
- The technical information in this document is for the purpose of explaining the typical operations and applications of the product, but not for granting any license or guarantee in regard to intellectual property rights, or any other rights, belonging to third parties or Toshiba.
- The product described in this document cannot be used in conjunction with products that are prohibited from production or sale by any rules, regulations, or laws in Japan or overseas.
- When exporting this product separately or combined with your equipment, please be sure to satisfy the objective conditions and inform conditions listed in the export control policies, so called Catch All restrictions, which are set by the Ministry of Economy, Trade and Industry of Japan, and the appropriate export procedures must also be taken.
